

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (currently amended) A file storage system comprising:
  - a gateway service adapted to service requests from clients for accessing files having respective file identifiers;
  - a storage service adapted to provide permanent storage of file data corresponding to the files; and
  - a metadata service adapted to maintain metadata corresponding to the files, a portion of the metadata for each file correlating a respective locations of the files in the storage service with the respective file identifiers,
  - the gateway service communicating with the metadata service to determine a location of the bitfile file data in the storage service in accordance with the file identifier, and with the storage service for providing clients access to the bitfile file data in accordance with the determined location, whereby the clients need only provide the file identifier to access the file from the determined location.
2. (currently amended) A file storage system according to claim 1, wherein the storage service comprises a plurality of storage devices, the location of the bitfile file data being associated with the plurality of storage devices.
3. (original) A file storage system according to claim 2, wherein the storage service is adapted so that the number of storage devices is scalable.
4. (currently amended) A file storage system according to claim 2, wherein the storage service and the metadata service are adapted so that the location of the bitfile file data

corresponding to a certain one of the files is associated with more than one of the plurality of storage devices.

5. (original) A file storage system according to claim 4, wherein the more than one of the plurality of storage devices are determined in accordance with a redundancy scheme.

6. (original) A file storage system according to claim 5, wherein the gateway service is adapted to provide access to an operable device of the more than one of the plurality of storage devices rather than a failed device of the more than one of the plurality of storage devices in accordance with a client request associated with the certain one of the files and with the location determined from the metadata service.

7. (original) A file storage system according to claim 4, wherein the more than one plurality of storage devices are determined in accordance with a striping scheme.

8. (original) A file storage system according to claim 1, wherein the gateway service comprises a plurality of gateway service nodes, the gateway service nodes being adapted to uniformly communicate with the metadata service, the storage service and the clients.

9. (original) A file storage system according to claim 8, further comprising a load balance adapted to distribute the requests from the clients to the plurality of gateway service nodes.

10. (original) A file storage system according to claim 8, wherein the gateway service nodes provide substantially the same performance in servicing the client file requests.

11. (original) A file storage system according to claim 8, wherein the gateway service is adapted so that the number of gateway service nodes is scalable.

12. (original) A file storage system according to claim 1, wherein the metadata service comprises a plurality of metadata nodes, the metadata nodes being adapted to uniformly communicate with the gateway service and to maintain the metadata.

13. (original) A file storage system according to claim 1, wherein the metadata service is adapted to implement a hierarchical storage management scheme.

14. (currently amended) A file storage system according to claim 2, wherein the metadata service is adapted to implement a hierarchical storage management scheme, a first set of the plurality of storage devices having a first capacity and performance characteristic, a second set of the plurality of storage devices having a second capacity and performance characteristic different than the first characteristic, the metadata service cooperating with the storage service to manage a migration of bitfile file data from the first set to the second set of storage devices, whereby clients requesting access to moved files corresponding to the migrated bitfile file data need only supply the file identifiers corresponding to the moved files.

15. (original) A file storage system according to claim 1, wherein the clients comprise one of at least one of a NFS client, a CIFS client, a HTTP client, and a FTP client, the gateway service being further adapted to service the client requests in accordance with the respective protocols used by the clients.

16. (currently amended) A file storage system comprising:

a scalable number of gateway servers each adapted to service requests from clients for accessing files having respective file identifiers;

a scalable number of storage servers each adapted to provide permanent storage of bitfile data corresponding to the files; and

a metadata service adapted to maintain metadata corresponding to the files, a portion of the metadata for each file correlating a respective locations of the files in the storage service with the respective file identifiers,

the gateway servers each communicating with the metadata service to determine a location of the bitfile data in the storage servers in accordance with the file identifier, and with the bitfile storage servers for providing clients access to the bitfile data in accordance with the determined location, whereby a client who accessed the file when the scalable number comprised a first value need only provide the same file identifier to access the file when the scalable number comprises a second value different than the first value.

17. (currently amended) A method for providing shared access to stored files, comprising:

servicing requests from clients for accessing files having respective file identifiers;

providing permanent storage of file data corresponding to the files in a first storage device; and

maintaining metadata corresponding to the files in a second storage device different than the first device, a portion of the metadata for each file correlating a respective locations of the files in the first storage device with the respective file identifiers,

determining a location of the bitfile file data in the first device in accordance with the file identifier from the metadata maintained in the second device; and

providing clients access to the bitfile file data from the first device in accordance with the determined location, whereby the clients need only provide the file identifier to access the file from the determined location.

18. (currently amended) A method according to claim 17, wherein the first storage device comprises a number of storage devices, the location of the bitfile file data being associated with the number of storage devices.

19. (original) A method according to claim 18, wherein the maintaining step includes accounting for a scaling of the number of storage devices.

20. (currently amended) A method according to claim 18, wherein the maintaining step includes correlating the location of the bitfile file data corresponding to a certain one of the files being associated with more than one of the number of storage devices.

21. (original) A method according to claim 20, further comprising determining the more than one of the number of storage devices in accordance with a redundancy scheme.

22. (original) A method according to claim 21, further comprising providing access to an operable device of the more than one of the number of storage devices rather than a failed device of the more than one of the number of storage devices in accordance with a client request associated with the certain one of the files and with the determined location.

23. (original) A method according to claim 20, further comprising determining the more than one of the number of storage devices in accordance with a striping scheme.

24. (original) A method according to claim 17, wherein the servicing step includes servicing the requests in a uniform manner by a plurality of gateway service nodes.

25. (original) A method according to claim 24, further comprising distributing the requests from the clients to the plurality of gateway service nodes.

26. (original) A method according to claim 24, wherein the gateway service nodes provide substantially the same performance in servicing the client file requests.

27. (original) A method according to claim 17, wherein the servicing step includes servicing the requests in accordance with at least one of a NFS protocol, a CIFS protocol, a HTTP protocol, and a FTP protocol.

28. (currently amended) A method according to claim 17, further comprising:

migrating certain of the bitfile file data from the first device to a third storage device different than the first and second storage devices; and

updating the metadata corresponding to the migrated bitfile file data to reflect the migrated location of the migrated bitfile file data,

whereby the clients need only provide the file identifier associated with the migrated bitfile file data to access the file from the migrated location.

29. (currently amended) A method according to claim 28, further comprising:

removing the bitfile file data from old locations in the first storage device.
